such manner as to cover said openings, and means extendible through said arcuate member for attaching the device to said mandible, said arcuate member being of such area as to approximately prevent relative movement thereof with respect to said mandible while the device is in operative position.

7. A goggle-like device for preventing pick-outs comprising two spaced apart upright members connected by an intermediate arcuate portion adapted to rest upon and straddle the beak of a fowl, transparent color modifying means carried by said arcuate portion, a pivot pin adapted to be passed through said arcuate portion and also through the breather openings in the beak of the fowl so as to anchor the device to said beak, said arcuate member being of such area as to approximately prevent relative movement thereof with

respect to the mandible while the device is in operative position, said pin having an angular portion, one of said upright members having a lug to engage said angular portion.

8. In a device for application to the beak of a fowl, said device having portions adapted to be positioned in front of and in close proximity to the eyes of a fowl, a bridge member of arcuate formation, and a fastening means extendible through arcuate portions of said bridge member and also through the beak of the fowl in such manner as to attach the device to said beak, said arcuate member being of such area as to approximately prevent relative movement thereof with respect to the beak while the device is in operation.

MAURICE L. RUDOLPH.
